

Continuous Exponential Growth and Decay

Solve each continuous exponential growth/decay problem. You may use the provided graph to plot points or sketch the exponential function.

- 1) A savings account balance is compounded continuously. If the interest rate is 3% per year and the current balance is \$1,854.00, what will the balance be 5 years from now?

- 2) Radioactive isotope Berkelium-247 decays exponentially. If the continuous decay rate is 50% per thousand years and the current mass is 804.90 grams, what will the mass be 7 thousand years from now?

- 3) For a period of time, an island's population grows exponentially. If the population doubles every 17 years and the current population is 1,725, what will the population be 10 years from now?

- 4) A savings account balance is compounded continuously. If the balance was \$1,183.63 8 years ago and the current balance is \$1,389.00, what will the balance be 5 years from now?

Solve each continuous exponential growth/decay problem.

- 5) For a period of time, E. coli bacteria in a culture grows exponentially. If the continuous growth rate is 1% per minute and the current population is 165.0 million, what will the population be 6 minutes from now?
- 6) Atmospheric pressure decreases approximately exponentially as elevation increases. If the continuous rate of decrease is determined to be 12% per kilometer and the pressure at sea level is 751.0 mmHg, what is the pressure at 8.3 kilometers above sea level?
- 7) A savings account balance is compounded continuously. If the balance doubles every 23 years and the current balance is \$1,059.00, what will the balance be 6 years from now?
- 8) For a period of time, an island's population grows exponentially. If the population was 1,128 6 years ago and the current population is 1,351, what will the population be 7 years from now?

Continuous Exponential Growth and Decay

Solve each continuous exponential growth/decay problem. You may use the provided graph to plot points or sketch the exponential function.

- 1) A savings account balance is compounded continuously. If the interest rate is 3% per year and the current balance is \$1,854.00, what will the balance be 5 years from now?

$$1854e^{0.03 \cdot 5} \approx \$2,154.04$$

- 2) Radioactive isotope Berkelium-247 decays exponentially. If the continuous decay rate is 50% per thousand years and the current mass is 804.90 grams, what will the mass be 7 thousand years from now?

$$804.9e^{-0.5 \cdot 7} \approx 24.31 \text{ grams}$$

- 3) For a period of time, an island's population grows exponentially. If the population doubles every 17 years and the current population is 1,725, what will the population be 10 years from now?

$$1725 \cdot 2^{\frac{10}{17}} \approx 2,593$$

- 4) A savings account balance is compounded continuously. If the balance was \$1,183.63 8 years ago and the current balance is \$1,389.00, what will the balance be 5 years from now?

$$1389 \cdot \left(\frac{1389}{1183.63} \right)^{\frac{5}{8}} \approx \$1,535.08$$

Solve each continuous exponential growth/decay problem.

- 5) For a period of time, E. coli bacteria in a culture grows exponentially. If the continuous growth rate is 1% per minute and the current population is 165.0 million, what will the population be 6 minutes from now?

$$165e^{0.01 \cdot 6} \approx 175.2 \text{ million}$$

- 6) Atmospheric pressure decreases approximately exponentially as elevation increases. If the continuous rate of decrease is determined to be 12% per kilometer and the pressure at sea level is 751.0 mmHg, what is the pressure at 8.3 kilometers above sea level?

$$751e^{-0.12 \cdot 8.3} \approx 277.4 \text{ mmHg}$$

- 7) A savings account balance is compounded continuously. If the balance doubles every 23 years and the current balance is \$1,059.00, what will the balance be 6 years from now?

$$1059 \cdot 2^{\frac{6}{23}} \approx \$1,268.89$$

- 8) For a period of time, an island's population grows exponentially. If the population was 1,128 6 years ago and the current population is 1,351, what will the population be 7 years from now?

$$1351 \cdot \left(\frac{1351}{1128}\right)^{\frac{7}{6}} \approx 1,667$$
